## Antibiotic Resistant Bacteria

Q:1 Some scientists tested the effectiveness of six new antibiotics, A, B, C, D, E and F.

- They mixed a culture of one species of bacterium with nutrient agar in a Petri dish.
- They then prepared separate discs of filter paper, each soaked in a different antibiotic.
- They placed the filter paper discs on the surface of the agar.
- The Petri dish was kept at $35{ }^{\circ} \mathrm{C}$ for 2 days.

The results are shown in the photograph.

(a) (i) Which two antibiotics from $A, B, C, D, E$ and $F$, did not kill this species of bacterium?

(1 mark)
(a)(ii) Which would be the best antibiotic, A, B, C, D, E or F, to treat an infection caused by this species of bacterium?
$\square$
(b) The scientists measured the production of an antibiotic by a mould. The graph shows their results.

(b)(i) Describe what happened to the concentration of antibiotic between 24 and 72 hours.
$\qquad$
$\qquad$
$\qquad$
$\qquad$
(b)(ii) The scientists decided to grow the mould for 42 hours in future.

Why did they choose this time?
$\qquad$
$\qquad$

Q:2 MRSA strains of bacteria are causing problems in many hospitals.
(a) The diagram shows a hand-gel dispenser.

Hand-gel dispensers are now placed at the entrance of most hospital wards.
Explain why.
$\qquad$
$\qquad$
$\qquad$
$\qquad$
(b) Explain, as fully as you can, how MRSA strains of bacteria became difficult to treat.
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

Q:3 Many strains of bacteria have developed resistance to antibiotics.
The table shows the number of people infected with a resistant strain of one species of bacterium in the UK.

| Year | $\mathbf{2 0 0 4}$ | $\mathbf{2 0 0 5}$ | $\mathbf{2 0 0 6}$ | $\mathbf{2 0 0 7}$ | $\mathbf{2 0 0 8}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Number of people infected <br> with the resistant strain | 3499 | 3553 | 3767 | 3809 | 4131 |

(a) Calculate the percentage increase in the number of people infected with the resistant strain between 2004 and 2008.

Show clearly how you work out your answer.
$\qquad$
$\qquad$

Percentage increase $=$ $\qquad$
(2 marks)
(b) Explain, in terms of natural selection, why the number of people infected with the resistant strain of the bacterium is increasing.
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

Q:4 Students in a school investigated the effect of five different antibiotics, $A, B, C, D$ and $E$, on one type of bacterium.

The students:
? ? grew the bacteria on agar jelly in a Petri dish
? soaked separate paper discs in each of the antibiotics

T 1 put the paper discs onto the bacteria in the Petri dish
? put the Petri dish into an incubator.
The diagram shows what the Petri dish looked like after 3 days.

(a) (i) What is the maximum temperature the incubator should be set at in the school?

Draw a ring around your answer.

$$
10^{\circ} \mathrm{C} \quad 25^{\circ} \mathrm{C} \quad 50^{\circ} \mathrm{C}
$$

(1 mark)
(a) (ii) Draw a ring around the correct answer to complete the sentence.

The inv xcv b cubator should not be set at a higher temperature because the higher pathogens.
temperature might help the growth of toxins.
viruses.
(1 mark)
(b) Which antibiotic, $A, B, C, D$ or $E$, would be best to treat a disease caused by this type of bacterium?

Write your answer in the box. $\square$
Give the reason for your answer.
$\qquad$
$\qquad$
(2 marks)
(c) Antibiotics cannot be used to treat diseases caused by viruses.

Why?
Tick (囤) one box.
Viruses are not pathogens
There are too many different types of virus $\square$
Viruses live inside cells $\square$
(1 mark)
