1.	$\left\{ \frac{dy}{dx} \times \right\}$ (crossed out) $\quad 6x - 4y\frac{dy}{dx} + 2 - 3\frac{dy}{dx} = 0$	Differentiates implicitly to include either $\pm ky\frac{dy}{dx}$ or $\pm 3\frac{dy}{dx}$. (Ignore $\left(\frac{dy}{dx} = \right)$.) Correct equation.	M1 A1

			7 marks

Beware: $\frac{dy}{dx} = \frac{2}{7}$ does not necessarily imply the award of all the first four marks in this question. So please ensure that you check candidates' initial differentiation before awarding the first A1 mark.

Beware: The final accuracy mark is for completely correct solutions. If a candidate flukes the final line then they must be awarded A0.

Beware: A candidate finding an m(**T**) = 0 can obtain A1ft for m(**N**) = ∞, but obtains M0 if they write $y - 1 = \infty(x - 0)$. If they write, however, **N**: x = 0, then can score M1.

Beware: A candidate finding an m(**T**) = ∞ can obtain A1ft for m(**N**) = 0, and also obtains M1 if they write $y - 1 = 0(x - 0)$ or y = 1.

Beware: The final **cso** refers to the whole question.

Beware: Owing to the symmetry of the curve between x = 0 and x = 2π candidates can find:

- Area = $2\int_0^{\pi} 3\sin\left(\frac{x}{2}\right)\,dx$ in part (a).

- Volume = $2\pi\int_0^{\pi} \left(3\sin\left(\frac{x}{2}\right)\right)^2\,dx$
