

Quadrilaterals

A closed figure formed by the four straight lines is called quadrilateral. There are different types of quadrilaterals. Here are some examples

<p>(1) A kite:- A kite has 2 pairs of adjacent sides equal. 1 pair of offsite angles equal. Diagonals cut at 90°. 1 line of symmetry.</p>	
<p>(2) An Arrowhead:- It has: 2 pairs of adjacent sides equal 1 line of symmetry</p>	
<p>(3) A rhombus: has: All sides equal Opposite sides parallel Opposite angles equal Adjacent angles are supplementary Diagonals that bisect at 90°</p>	
<p>(4) An isosceles Trapezium: has 1 pair of parallel lines. 1 line of symmetry.</p>	
<p>(5) Parallelogram: Opposite sides are parallel and equal. No lines of symmetry and the rotational symmetry of order 2.</p>	

Properties of Quadrilaterals: Sum of all four interior angles of quadrilaterals is 360 degree.

Define the following quadrilaterals.

1) Parallelogram.

2) Rectangle

3) Square.

4) Kite

5) Trapezium
